ToxPlex Array

# New ToxPlex Array

Introducing the new 29 analyte Biochip Array offering flexibility, customisation and semi-quantitative results.

| Drug Panel              |                  |                                 |
|-------------------------|------------------|---------------------------------|
| Acetaminophen           | Amphetamine      | Barbiturates                    |
| Buprenorphine           | Benzoylcegonine  | Cannabinoids (THC)              |
| Creatinine (Urine Only) | Dextromethorphan | Ethyl Glucuronide (EtG)         |
| Fentanyl                | Haloperidol      | Ketamine                        |
| Lorazepam               | MDMA             | Meprobamate                     |
| Methadone               | Methamphetamine  | Methaqualone                    |
| Opiate                  | Oxazepam         | Oxycodone                       |
| Phencyclidine (PCP)     | Pregabalin       | Propoxyphene                    |
| Salicylate              | Tramadol         | Tricyclic Antidepressants (TCA) |
| Zolpidem                | 6-MAM            | -                               |

## Fully Customisable

Test all 29 analytes or select any number of tests from this list to make a personalised panel.

## User-Defined Cut Offs

With a range of cut offs, you can select the cut off that is suitable for your market.

## Semi-Quantitative

Results from the ToxPlex array will be semi-quantitative on our new Evidence MultiSTAT software update.

## Dual Sample Input

Our first Evidence MultiSTAT panel that can run two samples simultaneously side by side.

## Available on Evidence MultiSTAT

For Urine/Blood
